

August 1st, 2010 Solar Tsunami

On August 1st, 2010 almost the entire earth faced a tumult of activity erupting on one side of the sun. This created disordering in electromagnetic and infrared controlled equipments on the earth. White area on the upper left of the image from the [Solar Dynamics](#)

[Observatory of NASA](#)

shows the C3-class solar flare. A solar tsunami (wave-like structure, upper right), multiple filaments of magnetism lifting off the stellar surface, large-scale shaking of the solar corona, radio bursts, a coronal mass ejection and more have happened because of that event. The effect has been detected by our experimentation team in Tehran, as well.
